

WATER DEVELOPMENT PLAN CONTENT REQUIREMENTS

All systems should contact the WUCB before developing a WDP to discuss the current requirements. The requirements are adapted from [19.26.2.19.B](#) NMAC. As of this date, all WDPs must include the following:

- A statement explaining which type of entity listed in §[72-1-9](#) best describes the system.
- A brief description of the community/water system location, including geographic and climatic conditions.
- A description of the water distribution system including the water source(s), point(s) of diversion, water treatment facilities, service area, and wastewater return flows if applicable.
- A summary of all water rights held by the applicant which will be subject to the plan.
- A table/summary of annual diversions for all water rights held by the applicant for the most recent 5-year period, including the number of connections/population served.
- An [NMOSE GPCD Calculator](#) for (at a minimum) the previous year, including a discussion of the results.
- An [AWWA Audit](#) for (at a minimum) the previous year, including a discussion of the results.
- A discussion of current and future water conservation efforts including measures, goals, and resources devoted to the efforts. Goals should be clear and measurable and include targets and timelines.
- Population projections for the system during the 40-year planning period including growth rates, data sources, and justification for the use of the selected figures.
- Calculations of water system demand during the 40-year planning period. The WUCB recommends that the results of the AWWA Audit, GPCD Calculator, population projections, planned conservation measures, and any unique factor(s) regarding the source of supply be considered when determining future demand.
- A discussion of the ability of the current water rights to satisfy the future demand.
